

**IN THE CLAIMS:**

1. (currently amended) A stiffened dilating balloon for use in the human body comprising:

an expandable balloon including a plurality of longitudinally discontinuous stiffening members disposed along a perimeter of said balloon;

wherein said balloon is made of a flexible material;

wherein the stiffening members are less flexible than said balloon;

wherein at least one of the stiffening members is connected to another one of the stiffening members by a filament; and

wherein each stiffening member affects a configuration of an area of said perimeter.

2. (currently amended) The balloon of claim 1 wherein the connected stiffening members are longitudinally aligned.

3. (currently amended) The balloon of claim 1 wherein the connected stiffening members are arranged at said perimeter in a staggered configuration.

4. (currently amended) The balloon of claim 3 wherein the connected stiffening members are arranged in a grid pattern.

5. (currently amended) The balloon of claim 1 wherein at least one of the connected stiffening members overlaps another one of the connected stiffening members.

6. (currently amended) The balloon of claim 1 wherein at least one of the connected stiffening members interdigitates with another one of the connected stiffening members.

7. (currently amended) The balloon of claim 1 wherein ~~at least one of the stiffening members is connected to another one of the stiffening members by a said~~ filament is elastic.

8. (currently amended) The balloon of claim 1 wherein the connected stiffening members have a geometric shape.

9. (currently amended) The balloon of claim 1 wherein the connected stiffening members have a ~~curved~~ cross-section with a perimeter that includes a curvilinear portion.

10. (currently amended) The balloon of claim 1 wherein the connected stiffening members have a polygonal cross-section.

11. (currently amended) The balloon of claim 1 wherein the connected stiffening members include at least one raised surface surfaces.

12. (currently amended) The balloon of claim 11 wherein ~~the a raised surface is~~ surfaces are substantially smooth.

13. (currently amended) The balloon of claim 11 wherein ~~the a raised surface is~~ surfaces are substantially pointed.

14. (currently amended) The balloon of claim 11 wherein ~~the a raised surface is~~ surfaces are sufficiently sharp to pierce an ~~occlusion~~ occlusive material.

15. (currently amended) The balloon of claim 11 wherein ~~the a raised surface~~ surfaces ~~have a saw-tooth configuration~~ comprises a saw-tooth cutting element.

16. (currently amended) The balloon of claim 1 wherein the connected stiffening members are disposed along the perimeter of only a longitudinally central section region of said balloon.

17. (currently amended) The balloon of claim 1 wherein at least one of the connected stiffening members comprises means for engaging an ~~occlusion~~ occlusive material in a lumen.

18. (currently amended) The balloon of claim 1 wherein at least one of the connected stiffening members comprises means for piercing an ~~occlusion~~ occlusive material in a lumen.

19. (currently amended) The balloon of claim 1 wherein at least one of the connected stiffening members comprises means for ~~temporarily retaining~~ removably coupling to a stent.

20. (currently amended) The balloon of claim 1 wherein at least one of the connected stiffening members comprises means for ~~temporarily retaining~~ removably coupling to a stent-graft.

21. (currently amended) The balloon of claim 1 wherein at least one of the connected stiffening members is located within said balloon abutting an inner surface of said balloon.

22. (currently amended) The balloon of claim 1 wherein ~~at least~~ a portion of at least one of the connected stiffening members is radio-opaque.

23. (currently amended) The balloon of claim 1 wherein the connected stiffening members are disposed on a sheet of material adapted to be applied to said balloon.

24. (withdrawn) A stiffened balloon comprising:  
an expandable balloon including a plurality of longitudinally continuous stiffening members disposed along a perimeter of said balloon;  
wherein said balloon is made of a flexible material;

wherein the stiffening members are less flexible than said balloon;

wherein each stiffening member affects a configuration of an area of said perimeter; and

wherein at least one of the stiffening members includes a projection adapted to temporarily retain a device at said balloon.

25. (withdrawn) The balloon of claim 24 wherein said device is a stent.

26. (withdrawn) The balloon of claim 24 wherein said device is a stent-graft.

27. (withdrawn) The balloon of claim 24 wherein at least one of the stiffening members is adapted to interdigitate with a device to temporarily retain said device at said balloon.

28. (withdrawn) The balloon of claim 27 wherein said device is a stent.

29. (withdrawn) The balloon of claim 28 wherein said stent includes at least one of an opening and an interface complementary to at least one of the projections.

30. (withdrawn) The balloon of claim 27 wherein said device is a stent-graft.

31. (withdrawn) The balloon of claim 30 wherein said stent-graft includes at least one of an opening and an interface complementary to at least one of the projections.

32. (withdrawn) The balloon of claim 24 wherein at least one of the stiffening members is radio-opaque.

Claims 33-40 (cancelled).

41. (withdrawn) A method of using a stiffened balloon to dilate a lumen and deploy an expandable device comprising the steps of:

introducing into a lumen a stiffened balloon bearing an expandable device;

expanding said balloon and said device to cause at least one projection on a stiffener of said balloon to protrude above an outer surface of said stent and engage an inner surface of the lumen;

dilating the lumen; and

deploying said device in the lumen.

42. (withdrawn) The method of claim 41 further comprising the step of piercing an occlusion in the lumen with a projection.

43. (withdrawn) The method of claim 41 wherein the lumen is an artery.

44. (withdrawn) A method of using a stiffened balloon to dilate a lumen and deploy an expandable device comprising the steps of:

interdigitating at least one projection on a stiffener of a stiffened balloon with an expandable device;

introducing into a lumen said stiffened balloon bearing said device;

expanding said balloon and said device;

dilating the lumen; and

deploying said device in the lumen.

45. (withdrawn) A stiffened balloon comprising:

an expandable balloon including a plurality of longitudinally continuous stiffening members disposed along a perimeter of said balloon;

wherein said balloon is made of a flexible material;

wherein the stiffening members are less flexible than said balloon;

wherein each stiffening member affects a configuration of an area of said perimeter; and

wherein at least one of the stiffening members includes a pivot point where the stiffening member may be bent to facilitate navigation of the balloon through a passage.

46. (withdrawn) A method of reconfiguring a portion of an expandable device deployed at a lumen comprising the steps of:

introducing into the lumen a stiffened balloon bearing a longitudinal stiffener at a first location on the balloon;

aligning said longitudinal stiffener with the portion of the expandable device; and

expanding said balloon to cause said stiffener to exert a first radial force against the portion of the expandable device to reconfigure the portion;

wherein said first radial force is greater than a radial force applied by said balloon at any other location on the balloon.

47. (withdrawn) The method of claim 46 wherein said step of aligning comprises the steps of:

determining an orientation of said longitudinal stiffener with reference to a radio-opaque portion of the stiffener; and

modifying the orientation of said longitudinal stiffener to align with the portion of the expandable device.

48. (new) The balloon of claim 1 wherein said filament is inelastic.

49. (new) The balloon of claim 1 wherein said filament is radio-opaque.

50. (new) The balloon of claim 1 wherein said filament is straight.

51. (new) The balloon of claim 1 wherein said filament is nonlinear.

52. (new) The balloon of claim 1 wherein said at least one stiffening member is connected to a plurality of the stiffening members by a corresponding plurality of filaments.

53. (new) The balloon of claim 1 wherein the connected stiffening members are disposed along the perimeter of only an end region of said balloon.

54. (new) The balloon of claim 1 wherein the connected stiffening members are disposed along the perimeter of a region of said balloon extending longitudinally no more than three-quarters of a length of said balloon.

55. (new) The balloon of claim 1 wherein at least one of the connected stiffening members includes a projection.

56. (new) The balloon of claim 55 wherein said projection is radio-opaque.

57. (new) The balloon of claim 55 wherein said projection has a pointed end.

58. (new) The balloon of claim 55 wherein said projection has a blunt end.

59. (new) The balloon of claim 55 wherein said projection has an end that is sufficiently sharp to pierce an occlusive material.

60. (new) The balloon of claim 55 wherein said projection has an end that is sufficiently sharp to penetrate a vessel wall.

61. (new) The balloon of claim 55 wherein said projection comprises a saw tooth cutting element.

62. (new) The balloon of claim 55 wherein said projection is adapted to removably couple to a device at said balloon.

63. (new) The balloon of claim 62 wherein said device is a stent.

64. (new) The balloon of claim 62 wherein said device is a stent-graft.

65. (new) The balloon of claim 62 wherein said projection is adapted to interdigitate with said device.

66. (new) The balloon of claim 55 wherein said projection is adapted to engage an occlusive material in a lumen.

67. (new) The balloon of claim 55 wherein said projection is adapted to deform an occlusive material in a lumen.

68. (new) The balloon of claim 1 wherein at least one of the connected stiffening members comprises means for removably coupling to a device.

69. (new) The balloon of claim 1 wherein a plurality of the connected stiffening members each includes a projection.

70. (new) The balloon of claim 69 wherein a projection is connected to another projection by a filament.

71. (new) The balloon of claim 69 wherein a projection is connected to a plurality of projections by a corresponding plurality of filaments.

72. (new) The balloon of claim 69 further comprising means for connecting a projection to another projection.

73. (new) The balloon of claim 1 wherein at least one of the connected stiffening members has a geometric shape.

74. (new) The balloon of claim 1 wherein at least one of the connected stiffening members has a cross-section with a perimeter that includes a curvilinear portion.

75. (new) The balloon of claim 1 wherein at least a portion of one of the connected stiffening members has a polygonal cross-section.

76. (new) The balloon of claim 1 wherein at least a portion of one of the connected stiffening members has a rectangular cross-section.

77. (new) The balloon of claim 1 wherein at least a portion of one of the connected stiffening members has a triangular cross-section.

78. (new) The balloon of claim 1 wherein at least one of the connected stiffening members is cylindrical.

79. (new) The balloon of claim 1 wherein at least one of the connected stiffening members is longitudinally straight-walled and has a rectangular cross-section.

80. (new) The balloon of claim 1 wherein the connected stiffening members are disposed along the perimeter of only a limited longitudinal region of said balloon.

81. (new) The balloon of claim 80 wherein said limited longitudinal region has a length no greater than three-quarters of a length of a cylindrical section of said balloon.

82. (new) The balloon of claim 1 wherein at least one of the connected stiffening members is located partly or entirely on an outer surface of a wall of said balloon.

83. (new) The balloon of claim 1 wherein at least one of the connected stiffening members is located entirely within a wall of said balloon.

84. (new) The balloon of claim 1 wherein at least one of the connected stiffening members is located partly or entirely on an inner surface of said balloon.

85. (new) The balloon of claim 1 wherein at least one of the connected stiffening members extends into a wall of said balloon and protrudes from a surface of said balloon.

86. (new) The balloon of claim 5 wherein a portion of a first connected stiffening member extends above an outer surface of said balloon and extends over a portion of a second connected stiffening member.

87. (new) The balloon of claim 86 wherein said first connected stiffening member is in contact with said second connected stiffening member.

88. (new) The balloon of claim 86 wherein said first connected stiffening member is not in contact with said second connected stiffening member.

89. (new) The balloon of claim 86 wherein said first connected stiffening member is connected to said second connected stiffening member by said filament.

90. (new) The balloon of claim 86 wherein said first connected stiffening member is not connected to said second connected stiffening member.

91. (new) The balloon of claim 11 wherein a raised surface is sufficiently sharp to penetrate a vessel wall.

92. (new) The balloon of claim 17 wherein said means for engaging comprises means for deforming said occlusive material.

93. (new) The balloon of claim 17 wherein said means for engaging comprises a projection.

94. (new) The balloon of claim 17 wherein said means for engaging comprises a raised surface.

95. (new) A stiffened dilating balloon catheter comprising:  
an expandable balloon including a plurality of longitudinally discontinuous stiffening members disposed along a perimeter of said balloon;  
wherein said balloon is made of a flexible material;  
wherein the stiffening members are less flexible than said balloon;  
wherein at least one of the stiffening members is connected to another one of the stiffening members by a filament; and  
wherein each stiffening member affects a configuration of an area of said perimeter.

96. (new) The balloon catheter of claim 95 wherein the connected stiffening members are longitudinally aligned.

97. (new) The balloon catheter of claim 95 wherein the connected stiffening members are arranged at said perimeter in a staggered configuration.

98. (new) The balloon catheter of claim 97 wherein the connected stiffening members are arranged in a grid pattern.

99. (new) The balloon catheter of claim 95 wherein at least one of the connected stiffening members overlaps another one of the connected stiffening members.

100. (new) The balloon catheter of claim 95 wherein at least one of the connected stiffening members interdigitates with another one of the connected stiffening members.

101. (new) The balloon catheter of claim 95 wherein said filament is elastic.

102. (new) The balloon catheter of claim 95 wherein the connected stiffening members have a geometric shape.

103. (new) The balloon catheter of claim 95 wherein the connected stiffening members have a cross-section with a perimeter that includes a curvilinear portion.

104. (new) The balloon catheter of claim 95 wherein the connected stiffening members have a polygonal cross-section.

105. (new) The balloon catheter of claim 95 wherein the connected stiffening members include at least one raised surface.

106. (new) The balloon catheter of claim 105 wherein a raised surface is substantially smooth.

107. (new) The balloon catheter of claim 105 wherein a raised surface is substantially pointed.

108. (new) The balloon catheter of claim 105 wherein a raised surface is sufficiently sharp to pierce an occlusive material.

109. (new) The balloon catheter of claim 105 wherein a raised surface comprises a saw-tooth cutting element.

110. (new) The balloon catheter of claim 95 wherein the connected stiffening members are disposed along the perimeter of only a longitudinally central region of said balloon.

111. (new) The balloon catheter of claim 95 wherein at least one of the connected stiffening members comprises means for engaging an occlusive material in a lumen.

112. (new) The balloon catheter of claim 95 wherein at least one of the connected stiffening members comprises means for piercing an occlusive material in a lumen.

113. (new) The balloon catheter of claim 95 wherein at least one of the connected stiffening members comprises means for removably coupling to a stent.

114. (new) The balloon catheter of claim 95 wherein at least one of the connected stiffening members comprises means for removably coupling to a stent-graft.

115. (new) The balloon catheter of claim 95 wherein at least one of the connected stiffening members is located within said balloon abutting an inner surface of said balloon.

116. (new) The balloon catheter of claim 95 wherein a portion of at least one of the connected stiffening members is radio-opaque.

117. (new) The balloon catheter of claim 95 wherein the connected stiffening members are disposed on a sheet of material adapted to be applied to said balloon.

118. (new) The balloon catheter of claim 95 wherein said filament is inelastic.

119. (new) The balloon catheter of claim 95 wherein said filament is radio-opaque.

120. (new) The balloon catheter of claim 95 wherein said filament is straight.

121. (new) The balloon catheter of claim 95 wherein said filament is nonlinear.

122. (new) The balloon catheter of claim 95 wherein said at least one stiffening member is connected to a plurality of the stiffening members by a corresponding plurality of filaments.

123. (new) The balloon catheter of claim 95 wherein the connected stiffening members are disposed along the perimeter of only an end region of said balloon.

124. (new) The balloon catheter of claim 95 wherein the connected stiffening members are disposed along the perimeter of a region of said balloon extending longitudinally no more than three-quarters of a length of said balloon.

125. (new) The balloon catheter of claim 95 wherein at least one of the connected stiffening members includes a projection.

126. (new) The balloon catheter of claim 125 wherein said projection is radio-opaque.

127. (new) The balloon catheter of claim 125 wherein said projection has a pointed end.

128. (new) The balloon catheter of claim 125 wherein said projection has a blunt end.

129. (new) The balloon catheter of claim 125 wherein said projection has an end that is sufficiently sharp to pierce an occlusive material.

130. (new) The balloon catheter of claim 125 wherein said projection has an end that is sufficiently sharp to penetrate a vessel wall.

131. (new) The balloon catheter of claim 125 wherein said projection comprises a saw tooth cutting element.

132. (new) The balloon catheter of claim 125 wherein said projection is adapted to removably couple to a device at said balloon.

133. (new) The balloon catheter of claim 132 wherein said device is a stent.

134. (new) The balloon catheter of claim 132 wherein said device is a stent-graft.

135. (new) The balloon catheter of claim 132 wherein said projection is adapted to interdigitate with said device.

136. (new) The balloon catheter of claim 125 wherein said projection is adapted to engage an occlusive material in a lumen.

137. (new) The balloon catheter of claim 125 wherein said projection is adapted to deform an occlusive material in a lumen.

138. (new) The balloon catheter of claim 95 wherein at least one of the connected stiffening members comprises means for removably coupling to a device.

139. (new) The balloon catheter of claim 95 wherein a plurality of the connected stiffening members each includes a projection.

140. (new) The balloon catheter of claim 139 wherein a projection is connected to another projection by a filament.

141. (new) The balloon catheter of claim 139 wherein a projection is connected to a plurality of projections by a corresponding plurality of filaments.

142. (new) The balloon catheter of claim 139 further comprising means for connecting a projection to another projection.

143. (new) The balloon catheter of claim 95 wherein at least one of the connected stiffening members has a geometric shape.

144. (new) The balloon catheter of claim 95 wherein at least one of the connected stiffening members has a cross-section with a perimeter that includes a curvilinear portion.

145. (new) The balloon catheter of claim 95 wherein at least a portion of one of the connected stiffening members has a polygonal cross-section.

146. (new) The balloon catheter of claim 95 wherein at least a portion of one of the connected stiffening members has a rectangular cross-section.

147. (new) The balloon catheter of claim 95 wherein at least a portion of one of the connected stiffening members has a triangular cross-section.

148. (new) The balloon catheter of claim 95 wherein at least one of the connected stiffening members is cylindrical.

149. (new) The balloon catheter of claim 95 wherein at least one of the connected stiffening members is longitudinally straight-walled and has a rectangular cross-section.

150. (new) The balloon catheter of claim 95 wherein the connected stiffening members are disposed along the perimeter of only a limited longitudinal region of said balloon.

151. (new) The balloon catheter of claim 150 wherein said limited longitudinal region has a length no greater than three-quarters of a length of a cylindrical section of said balloon.

152. (new) The balloon catheter of claim 95 wherein at least one of the connected stiffening members is located partly or entirely on an outer surface of a wall of said balloon.

153. (new) The balloon catheter of claim 95 wherein at least one of the connected stiffening members is located entirely within a wall of said balloon.

154. (new) The balloon catheter of claim 95 wherein at least one of the connected stiffening members is located partly or entirely on an inner surface of said balloon.

155. (new) The balloon catheter of claim 95 wherein at least one of the connected stiffening members extends into a wall of said balloon and protrudes from a surface of said balloon.

156. (new) The balloon catheter of claim 99 wherein a portion of a first connected stiffening member extends above an outer surface of said balloon and extends over a portion of a second connected stiffening member.

157. (new) The balloon catheter of claim 156 wherein said first connected stiffening member is in contact with said second connected stiffening member.

158. (new) The balloon catheter of claim 156 wherein said first connected stiffening member is not in contact with said second connected stiffening member.

159. (new) The balloon catheter of claim 156 wherein said first connected stiffening member is connected to said second connected stiffening member by said filament.

160. (new) The balloon catheter of claim 156 wherein said first connected stiffening member is not connected to said second connected stiffening member.

161. (new) The balloon catheter of claim 105 wherein a raised surface is sufficiently sharp to penetrate a vessel wall.

162. (new) The balloon catheter of claim 111 wherein said means for engaging comprises means for deforming said occlusive material.

163. (new) The balloon catheter of claim 111 wherein said means for engaging comprises a projection.

164. (new) The balloon catheter of claim 111 wherein said means for engaging comprises a raised surface.

165. (new) A stiffened dilating balloon for use in the human body comprising:  
an expandable balloon including a plurality of longitudinally discontinuous stiffening members disposed along a perimeter of said balloon; and

means for connecting at least one of the stiffening members to another one of the stiffening members;

wherein said balloon is made of a flexible material;

wherein the stiffening members are less flexible than said balloon; and

wherein each stiffening member affects a configuration of an area of said perimeter.

166. (new) A stiffened dilating balloon catheter comprising:  
an expandable balloon including a plurality of longitudinally discontinuous stiffening members disposed along a perimeter of said balloon; and

means for connecting at least one of the stiffening members to another one of the stiffening members;

wherein said balloon is made of a flexible material;

wherein the stiffening members are less flexible than said balloon; and

wherein each stiffening member affects a configuration of an area of said perimeter.

167. (new) A method of dilating a portion of a lumen in a human body comprising the steps of:

introducing into said human body an expandable balloon including a plurality of longitudinally discontinuous stiffening members disposed along a perimeter of said balloon;

wherein said balloon is made of a flexible material;

wherein the stiffening members are less flexible than said balloon;

wherein at least one of the stiffening members is connected to another one of the stiffening members by a filament; and

wherein each stiffening member affects a configuration of an area of said perimeter;

positioning said expandable balloon at said portion; and

expanding said expandable balloon to cause the connected stiffening members to exert a first radial force against said portion;

wherein said filament prevents a distance between the connected stiffening members from exceeding a maximum distance; and

wherein said first radial force is greater than a radial force directly applied by an outer surface of said balloon against said portion.

168. (new) The method of claim 167 wherein the step of positioning said expandable balloon includes the step of traversing a tortuous pathway in said human body.

169. (new) The method of claim 167 wherein said portion comprises a stenosis.

170. (new) A method of dilating a device in a lumen in a human body comprising the steps of:

introducing into said human body an expandable balloon including a plurality of longitudinally discontinuous stiffening members disposed along a perimeter of said balloon;

wherein said balloon is made of a flexible material;

wherein the stiffening members are less flexible than said balloon;

wherein at least one of the stiffening members is connected to another one of the stiffening members by a filament; and

wherein each stiffening member affects a configuration of an area of said perimeter;

positioning said expandable balloon at said device; and

expanding said expandable balloon to cause the connected stiffening members to exert a first radial force against said device;

wherein said filament prevents a distance between the connected stiffening members from exceeding a maximum distance; and

wherein said first radial force is greater than a radial force directly applied by an outer surface of said balloon against said device.

171. (new) The method of claim 170 wherein the step of positioning said expandable balloon includes the step of traversing a tortuous pathway in said human body.

172. (new) The method of claim 170 wherein said device is a stent.

173. (new) The method of claim 170 wherein said device is a stent-graft.
